

LAB EXERCISE 9

Database with VIEW and INDEX

AIM

To create and manipulate a **VIEW** and an **INDEX** on the `Vegetable` table to simplify data retrieval and improve query performance.

PROCEDURE

1. Create the `Vegetable` table with `VegID`, `VegName`, `Category`, `Price`, and `Quantity`.
2. Insert vegetable records into the table.
3. Create a **VIEW** to display selected columns from the `Vegetable` table.
4. Retrieve data from the created VIEW.
5. Create an **INDEX** on the `VegName` column.
6. Use the indexed column to search for a particular vegetable.
7. Display the indexes associated with the table.

SQL COMMANDS:

3. Create INDEX

```
CREATE INDEX idx_vegname  
ON Vegetable (VegName);
```

4. Search using INDEX

```
SELECT *  
FROM Vegetable  
WHERE VegName = 'Carrot';
```

```
mysql> SELECT * FROM Vegetable WHERE VegName = 'Carrot';
```

VegID	VegName	Category	Price	Quantity
103	Carrot	Root	40.00	80

1 row in set (0.03 sec)

5. Display INDEX

```
SHOW INDEX FROM Vegetable;
```

```
mysql> SHOW INDEX FROM Vegetable;
```

Table	Non_unique	Key_name	Seq_in_index	Column_name	Collation	Cardinality	Sub_part	Packed	Null	Index_type	Comment	Index_comment
vegetable	YES	PRIMARY	1	VegID	A	8	NULL	NULL	YES	BTREE		
vegetable	YES	idx_vegname	1	VegName	A	8	NULL	NULL	YES	BTREE		

2 rows in set (0.04 sec)

mysql>
